Capstone Project

2026/2027

Miguel Brinkmann Cardoso

September 2026

Due **Sunday, 4 October 2026, at 23:59**.

The team's representative submits it on Moodle, once for the whole team: one page at most, as a PDF or as text in the submission box. Name a PDF `TeamName_Proposal.pdf`, or use the representative's name if the team has no name yet.

Use the four sections below, in this order.

The proposal fixes your team and your first idea. Both can change until the technical proposal in Week 12, but an idea that has been researched now is one you will not have to replace later. Using AI to brainstorm and draft is encouraged.

1. Team

Teams have up to four members.

- Team name. Optional for now; it becomes your startup's name.
- The representative.
- Every member: name, student ID, email.
- For each member: the role they would like, and what they plan to contribute.

2. The idea

- What problem does the app solve, and for whom?
- What already exists for that problem, and what will yours do differently?
- What will users be able to do with it?
- What data or documents will it need, and can you get them?
- What does the AI do in it that ordinary code could not? For example: hold a conversation, call your own functions, answer questions from documents, read images, extract data from text, generate content.

3. One interaction, end to end

Pick the most important thing a user does. In three to five sentences: what the user writes, what the model receives, what it returns, and what your code does with that before the user sees an answer.

4. Questions

Optional. Anything about scope, data or technical choices you want an answer to before you commit.

Example

A short illustration of the kind of content each section asks for. Your proposal should go further in every section.

> **TravelPlan AI** helps students plan trips on a budget without paying for a travel agent. Booking sites find flights and hotels, but none of them keeps a group's spending against a shared budget.
>
> Users plan in a chat, refining the trip over several messages. The AI turns a message like "two nights in Porto under 200 euros" into a trip with a city, dates and a budget; decides when to record a cost, check the weather or convert a currency; and answers questions about visa requirements from the PDFs users upload.
>
> **One interaction.** The user writes "add a 45 euro dinner on Friday". The model receives the message and the trip so far, and returns a cost of 45 euros for Friday's dinner. Our code checks that the date falls within the trip, records the cost, and the reply shows the updated total.
